

Individual Power

Individual freedom is directly proportional to individual power, because an individual may only choose among acts he's capable of.

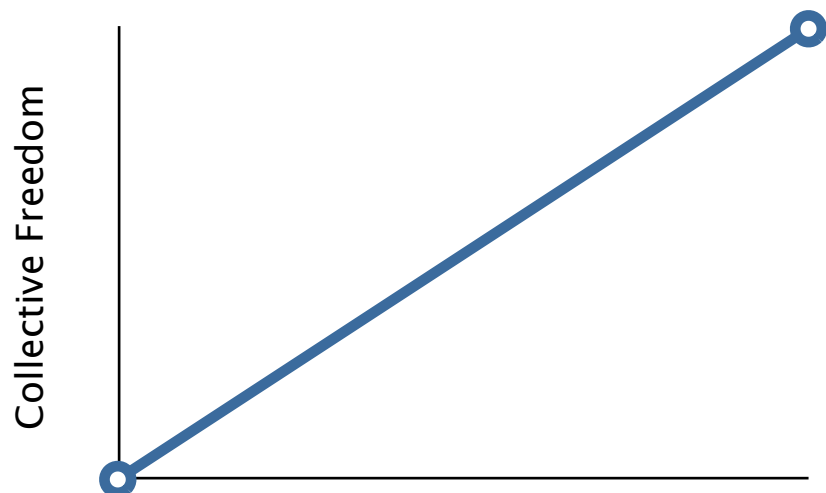

Example: One may not freely choose to fly, unless powered by a flying machine.

Individual Power

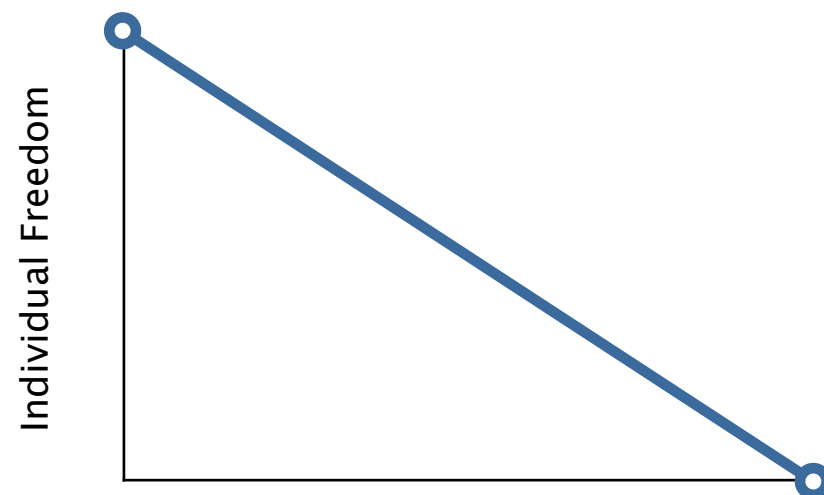

Individual power is inversely proportional to collective freedom, because we live in an environment where resources are finite.

Example: An employee is not free to do his work in a way other than what his employer dictates, by virtue of the employer having the power to fire him.

Collective Power

Collective freedom is directly proportional to collective power, which is best exemplified when comparing nations. The population of a powerful country such as the United States, enjoys more collective freedom relative to the population of a weak country, such as Sudan.

Collective Power

Collective power is inversely proportional to individual freedom, as the individual must abide by rules set by the collective.

Example: You may not board a public bus to a destination other than those predetermined in the bus's route.
